

Network Diagram Naming Conventions

Packet Tracer Settings

Ensure that the **Show device model labels** and **Show device name labels** boxes are checked (checked by default). This can be found in **Options**, then **Preferences**.

Naming Conventions for Asset Types

Follow these conventions in your network diagram:

- The network name (e.g., Subnet1, Subnet2) should be at the top.
- PC naming should follow this example: "PC#_network name."
- Network switches should be labeled with "network_name#_switch."
- Network routers should be labeled with "network_name#_router."
- Network cables should be labeled with the network IP address.
- Network servers should be labeled with "ServerName_Network."
- Network asset devices connecting networks should have meaningful names and follow existing conventions when applicable.

Titling Conventions for Students

Include your name, course code, and section number as a label in the box provided in the top left corner.
